

Pneumatic Cylinders

E.MC has been creating, developing and continuously improving the quality and design of your pneumatic cylinders for over 20 years. The extensive technical research team at E.MC continues to strive for improved methods and technologies. Our manufacturing facilities operate seamlessly with quality testing and monitoring at the top priority. The 3-point positioning system used to precisely machine head caps and pistons utilizes cutting edge 3D CNC machining.

As a global distributor of high end pneumatics, our products provide the solutions you need for your most challenging projects.

At E.MC we're committed to excellence, precision and ongoing development. Let us take you from 'Good to Great'.

Installation and Use

- To ensure the component has not been damaged during transport please inspect the device prior to installation.
- Confirm the pneumatic cylinder selected aligns with the loader.
- If using a pneumatic cylinder supporting high temperatures or cold environments, utilize anti-freezing measures or cooling accessories.
- Before connecting tubing to your pneumatic cylinder, make sure all lines are clean and free of debris. We recommend cleaning your working medium with a minimum 25um filtration prior to installation.
- Applying lateral load may limit the life cycle of your pneumatic cylinder if not installed properly. Please ensure you are installing on a clean, level surface.
- If storing your pneumatic cylinder for future use, always ensure the device is treated with an anti-rust treatment and keep all air ports covered.

Attention Points

- Place filter near the direction control valve to remove any possible iron rust, particles or water which may have accumulated in the tube.
- When using your cylinder in corrosive environments always use appropriate tubing materials in conjunction with the device.
- Ensure the cross section of tube between the cylinder and directional control valve has the appropriate selection based on your stated piston speed.
- Remove all particulates, iron rust etc. prior to installation or repair.
- Always use appropriate seals and lubricants to connect your component.
- Piston rods should be chosen for use based on actual load. Varying load rates may adversely affect the performance of the component.

After Use

- When installing the cylinder in temperatures below 5°C or above 60°C, use the appropriate sealing materials. Ex: Viton, Teflon tape etc.
- If using pneumatic cylinders in corrosive or dangerous environments, take appropriate protective measures. We recommend you contact us if you intended use extends into harsh environments.
- The compressed air entering the component but be free of particles and moisture.
- The air cushion is designed to absorb the impact of the piston at the end of the stroke.
- The cushion positioning is pre-set with your device. Adjusting the cushion can be done by adjusting the needle valve to the right to strengthen the buffer, or left to weaken it.
- For best results avoid using the pneumatic cylinder directly under cutting compounds, refrigerants, rust and corrosive spatter.

Please Note

- Always use the correct cylinder for the appropriate amount of force for your objective.
- Applying excessive force causing damage to the cylinder barrel may create scaring within the barrel resulting in poor performance.
- Please ensure you are installing your cylinder on a level surface to avoid shifting which could result in poor performance of your component.
- Always use the appropriate cylinder for your specific project. Installing the incorrect cylinder for your project can result in damage to your device.

Product Selection

- Confirm the internal diameter of the cylinder
 - Axial load thrust of the cylinder shall be confirmed according to actual load situation of the required cylinder;
 - Load rate η of the cylinder shall be confirmed according to the action situation of the load;
Load rate has relationship with action speed of the cylinder, which is generally recommended as:
Under static load or low speed: $\eta \leq 0.7$
Speed 50-50mm/s: $\eta \leq 0.5$
When speed >500mm/s: $\eta \leq 0.3$
 - Working pressure of the cylinder shall be confirmed according to the condition of air supply.
- Confirm the cylinder stroke
The stroke of cylinder is pre-selected according to the ratio of cylinder operation distance and stroke of transmission mechanism. To facilitate installing and debugging, there shall be proper allowance left for the stroke calculated. Standard strokes guaranteed with quick supply are advised to be chosen as possible as one can, which can help to cut down your cost.
- Confirm the cylinder type
The type of the cylinder shall be selected according to the specific requirements of application and installation of the cylinder.
- Selection of buffer way of the cylinder
There are different buffer devices equipped to the cylinders made by our company. Customer shall choose them according to the action situation of actual load. If both of the load and speed are higher, it is difficult to absorb the impact only by the buffer of the cylinder itself. Therefore, buffer circuit must be designed or use external buffer to release the impact.
- Confirm whether the cylinder has magnet
Whether the cylinder has sensor switch shall be confirmed according to the actual situation. And relative magnetic switch shall be chosen to use together.
- Selection of installation mode of the cylinder
Installation mode of the cylinder shall be selected according to the application and installation requirements of the cylinder.
- Selection of connecting mode of piston rod of the cylinder
After the cylinder is pre-selected, it is necessary to check the stability of piston rod (especially the piston is thinner, longer and larger) of the cylinder according to different installation modes and the air consumption under actual application condition shall be checked.

Maintenance and Service

- Maintenance should be done under safety condition, please turn off the power and air source first; making sure there is no air leaving in the tube;
- Before attaching/removing rod end attachments, the cylinder must be fully retracted. The rod should never be pulled out, or be rotated when attaching/removing the rod end attachments. The rod end attachment should be screwed tightly on the rod end, with balanced locking force. Before usage, make sure no interference is present by manually checking the cylinder and attachment. After that, air can be supplied to the cylinder for use;
- There should be no damage in the sliding parts between the cylinder and piston rod to prevent the air leakage caused by poor action of the cylinder and damage of seal parts of piston rod;
- If the cylinder is not used for a long time, it shall be regularly actuated and shall be coated with oil to prevent it get rusted;
- Please read the relevant content in this manual for the requirement of the cylinder about the air quality, application condition, tube connection and cylinder lubrication.

Debugging

- Speed control valve shall be installed at the two sides of the cylinder.
 - Check valve shall be opened gradually from completely closed state when the cylinder is debugged and the drive speed of the cylinder shall be gradually and slowly adjusted to the required speed.
 - There are two ways for installing check valve, including exhaust throttle and inlet throttle. Exhaust throttle is mostly adopted in pneumatic system because the cylinder will produce back pressure during work through exhaust throttle and ensuring relatively stable moving speed or speed adjustment, which will help avoid impact on cylinder cover caused by sudden and quick propulsion of piston rod when starting.
- When the cylinder with buffer function is debugged, according to the load and speed, the flow control valve mounted on the cylinder cover shall be adjusted gradually from low to high level to ensure the cylinder will have no rebounding. What shall be noticed is not to adjust the buffer to the end state in debugging the stroke, otherwise there will be poor buffer or damage of seals caused by piston under high-speed situation.

Installation and Use

- 1、 Prevent debris and dirt and other impurities into the cylinder before connect with pipe. 1~1.5 thread pitch should be reserved for wrapping tape. Don't wrap the tape around .

- 2、 To avoid overusing or inflowing of the liquid glue into the body when using liquid fixing glue (anaerobic adhesive) to lock the fitting, or it will get the parts stuck, leading not good performance.

- 3、 The axes of piston rod shall corresponde with the moving direction of load (coaxial). Piston rod and cylinder will produce opposite force which can easily damage the internal. The internal surface of the cylinder, guide sleeve, the surface of piston rod and seals.

- 4、 Avoid direct connection of piston rod, or it will suffer vertical gravity: it shall add idler wheels under the load bottom to support the guide rail(as in below right photo). It is wrong installation as in below left photo, because the piston rod and cylinder will produce opposite force which can easily bend piston rod and damage the internal surface of the cylinder, guide sleeve, the surface of piston rod and seals.

- 5、 Avoid direct connection of piston rod, or it will suffer vertical gravity: it shall add idler wheels under the load bottom to support the guide rail(as in below right photo). It is wrong installation as in below left photo, because the piston rod and cylinder will produce opposite force which can easily bend piston rod and damage the internal surface of the cylinder, guide sleeve, the surface of piston rod and seals.

- 6、 To prevent that back activity hinge is far from force supply point, the piston rod will be influenced by torque force. To use middle action support to shorten the long distance between support point and force supply point.

- 7、 Long-stroke cylinder shall set middle guide support to prevent natural drop of piston rod and to prevent the damage on piston rod caused by the droop of piston rod, bend of the cylinder, vibration and external load.

- 8、 It tends to bend at long stroke, thus the installation bracket shall be moved to the front cover.

- 9、 The fixed cylinder shall not be connected with the rocker carrying out circular action (fixed with LB). At this time, it shall be connected with swing cylinder (fixed with CA/ CB/TC)

Installation and Use

- 10、 If the height (H) between installation surface of bearing bracket and the position of bearing is too great, when cylinder works, the installation part of the support will produce great torque force, Which may cause damage to installing bolt and other parts.

- 11、 Proper installation shall be adopted considering the direction of load (flange type installation).

Allowable Kinetic Energy and Rotation Time Adjustment Range

Model	Allowable kinetic energy (J)		Rotation time adjustment range for stable operation (s/90°)	
	With adjustment bolt	With shock absorber	With adjustment bolt	With shock absorber
EMQ7	0.006	None	0.2~1.0	None
EMQ10	0.01	0.04	0.2~1.0	0.2~0.7
EMQ20	0.025	0.12	0.2~1.0	0.2~0.7
EMQ30	0.05	0.12	0.2~1.0	0.2~0.7
EMQ50	0.08	0.30	0.2~1.0	0.2~0.7

Note 1. If operated where the kinetic energy exceeds the allowable value, this may cause damage to the internal parts and result in product failure. Please pay special attention to the kinetic energy levels when designing and during operation to avoid exceeding the allowable limit.
2. When the rotation time of the type with an internal absorber is set longer than the time shown in the table above, energy absorption of the shock absorber greatly decreases.

Effective Output Torque

Installation and Use

1. Rotation direction and rotation angle

- When pressurized from port A, the shaft rotates clockwise and counter-clockwise when pressurized from port B.
- To obtain the desired rotation angle, the rotation ends can be set within the range shown in the diagram by regulating the adjustment bolt.
- Rotary table with a shock absorber is available to adjust the rotation angle.

2. Rotation range example:

- Rotation can be set by adjusting the A & B adjuster bolts.
- Rotary tables with shock absorbers can be set to various angles.

3. Adjustment angle per rotation (Adjustment bolt or shock absorber)

The adjustment angle of the turntable for each turn is as follows:

Bore size	Adjustment angle per rotation
7	10.2°
10	10.2°
20	7.4°
30	6.5°
50	8.2°

- The rotation angle has been adjusted to the maximum output at the factory. Please do not extend the rotation angle beyond the maximum factory setting.
- The movement energy should not exceed the maximum allowable energy, or the inner components can be damaged.
- The rotary parts do not require lubrication.
- Minimum operation pressure for a rotary table with a shock absorber is no less than 0.1Mpa.

8. Refer to the table below for tightening torques of the shock absorber setting nut.

Shock absorber size	Max. tightening torque (Nm)
M8X1.0	2.5
M10X1.0	3.5
M14X1.5	11

- Never loosen the bottom screw of the shock absorber. That may cause oil leakage.
- Shock absorbers are consumable parts. When a decrease in energy absorption capacity is noticed, it must be replaced.

Product Features

1. Single piston structure, large gripping torque.
2. Integrated with variable throttle valve, easy to adjust the gripping jaw opening & closing speed.
3. Reasonable gripping angle, wide range of application.
4. Accurate positioning accuracy, it is more accurate and reliable when gripping workpiece.
5. Multi mounting type, convenient for use in different application.
6. All series with magnet, easy to control.

Optional Accessories

Note: Short stroke please use HX-29 series due to limited space.

Installation and Use

1. Installing a fall prevention device is recommended when applying a lowering clamping force. In the case of a sudden pressure decrease due to emergency stop, these prevention devices can help to avoid personal or equipment injuries.
2. Air grippers are not intended for use under strong external or heavy impact forces.
3. When installing or repairing your air gripper take precautions to safely use your component.
4. Don't reverse the clamping gripper when installing clamping parts.
5. The locking torque of the fastening screw must be within the prescribed torque range shown in the chart below. If the locking torque is not set properly the unit will not perform correctly.

7. When gripping an object, the item must be placed in the centre of the two gripping jaws, and the two gripping jaws should touch the object at the same time.
8. Avoid applying external forces to the gripping jaw. Always leave enough space to adequately grip and place your object. The gripper should be free moving.
9. When gripping an object the item should always be centred. When testing, you must reduce the pressure for low speed running, to guarantee the safety and no impact.
10. Please use the flow control valve to adjust the opening and closing speed of your gripper.
11. Always ensure the gripper path is clear of obstruction.
12. Before removing your air gripper, please make sure all power is disconnected and you've discharged residual compressed air.

Order Example:

Parallel air gripper, Bore 20, with magnet, ERP code is: SHZ20-S

Product Features

1. Integrated design of linear guide rail, high rigidity, high precision;
2. Positioning pin at the bottom of the linear guide rail, efficiently preventing deviation of guide rail from the body;
3. Deeper attached fixing benchmark centering hole, improving fixing accuracy, and improving consistency after repeated dismounting and fixing
4. According to the actual requirements of the customer, the initial position of the claw can be customized to meet the different needs under different working conditions.

Optional Acces:

Note: Short stroke please use HX-29 series due to limited space.

Installation and Use

1. Installing a fall prevention device is recommended when applying a lowering clamping force. In the case of a sudden pressure decrease due to emergency stop, these prevention devices can help to avoid personal or equipment injuries.
2. Don't use air gripper upon strong external force and impact force. Air grippers are not intended for use under external or impact forces.
3. When installing or repairing your air gripper take precautions to safely use your component.
4. Please contact with us when using the single acting type gripper for specific spring action force information.
5. Don't reverse the clamping gripper when installing clamping parts.
6. The locking torque of the fastening screw must be within the prescribed torque range shown in the chart below. If the locking torque is not set properly the unit will not perform correctly.

SHR Series 180°Open/Close Style Air gripper, Bore25,with magnet,ERP code is:SHR25-S

Product Features

1. Unique design for the opening and closing, effectively preventing foreign objects from entering
2. Special shutter used between fingers and body, reducing wearing and extending lifetime
3. 180° opening and closing type, simplify gripping and releasing, avoid workpiece motion space, wider applications
4. Built-in sensor switch groove, easy for mounting
5. Multi mounting types, convenient for using under different conditions
6. All sizes are built with magnet, easy for controlling

How to select product

1. Confirmation of effective gripping force

- 1.1 Although the coefficient of friction between the attachments and the workpiece differ, select a model that can provide a gripping force of 10 to 20 times the workpiece mass, or more.
- 1.2 If high acceleration, deceleration or impact forces are encountered during motion, a further margin of safety should be considered. Example) given workpiece mass: 0.05kg, gripping point L: 30mm, the pressure: 5kgf/cm² Required gripping force = 0.05 kg x 20 x 9.8 m/s² = 10 N min Model selection: HFR16 is recommended. The gripping force is 17N, therefore satisfies a gripping force setting value of 20 times or more

- 1.3 The effective gripping force shown in the graphs to the right is expressed as F, when both fingers and attachments are in full contact with the workpiece.

2. Connection between gripping force and gripping point distance

3. The selection of the gripping point

- 3.1 Workpiece should be held at a point within the range of overhanging distance (H) for a given pressure indicated in the tables below. When the workpiece is held at a point outside of the recommended range for a given pressure, it may cause adverse effect on the product life.
- 3.2 Within the allowable range of gripping point, the fixture shall be shore and light; when it is long and heavy, the inertia force when finger open and close, it will influence the performance and lifetime of the fingers at the same time.

Installation and application

- Due to the abrupt changes, the pressure is low, which will lead to the decrease of the gripping force and falling of the work-pieces. In order to avoid the harm to the human body and damage to the equipment, anti-dropping device must be equipped.
- Don't use the air gripper under strong external force and impact force.
- When install and fix the air gripper, avoid falling down, collision and damage.
- When fixing the gripping jaw parts, don't twist the gripping jaw.
- There are several kinds of installation method, and the torque of fastening screw must be within the prescribed moment range shown in the below chart. If the locking moment is too large, it will cause the dysfunctional. If the locking moment is too small, it will cause the position deviation and fall.

16	M4X0.7	1.5	5
20	M5X0.8	3.5	8
25	M6X1.0	6	10

6. The installation method of the gripping jaw fittings.

When install the gripping jaw fittings, you have to pay particular attention that you can only hold the gripping jaw by using spanner, and then lock the screws with allen wrench. Never clamp the body directly and then lock the screws, otherwise the parts will be easily damaged.

Please refer to below chart for the locking torque.

Bore	Bolt Size	Max.Locking Torque (Nm)
10	M3X0.5	0.6
16	M3X0.5	0.6
20	M4X0.7	0.8
25	M5X0.8	1.5

7. When gripping, the workpiece must be located in the center line between fingers, and the two fingers shall touch the workpiece at the same time, otherwise they could easily get broken.

8. Confirm that there is no additional external forces exerted on the fingers. Transverse load acts on the fingers, which will cause impact load, leading to the shaking and damage of gripping jaw. Equip with gaps so that the air gripper will not crash into work-pieces and accessories at the end of its trip.

9. When workpieces inserted, the center line should be coaxial, no offset, in case there are additional external force generated on the jaw. When testing, it is specially required that the manual operation should be reduced and the pressure should be used to run it at a low speed, and guarantee the safety and no impact.

10. Please use the flow control valve to adjust the opening and closing speed of gripping jaw if too fast.

11. People cannot enter the movement path of air gripper and articles cannot be placed on the path too.

12. Before removing the air gripper, please confirm that it is out of working state, and then discharge of compressed air.

Product type

1. Please select pneumatic finger according to the following steps

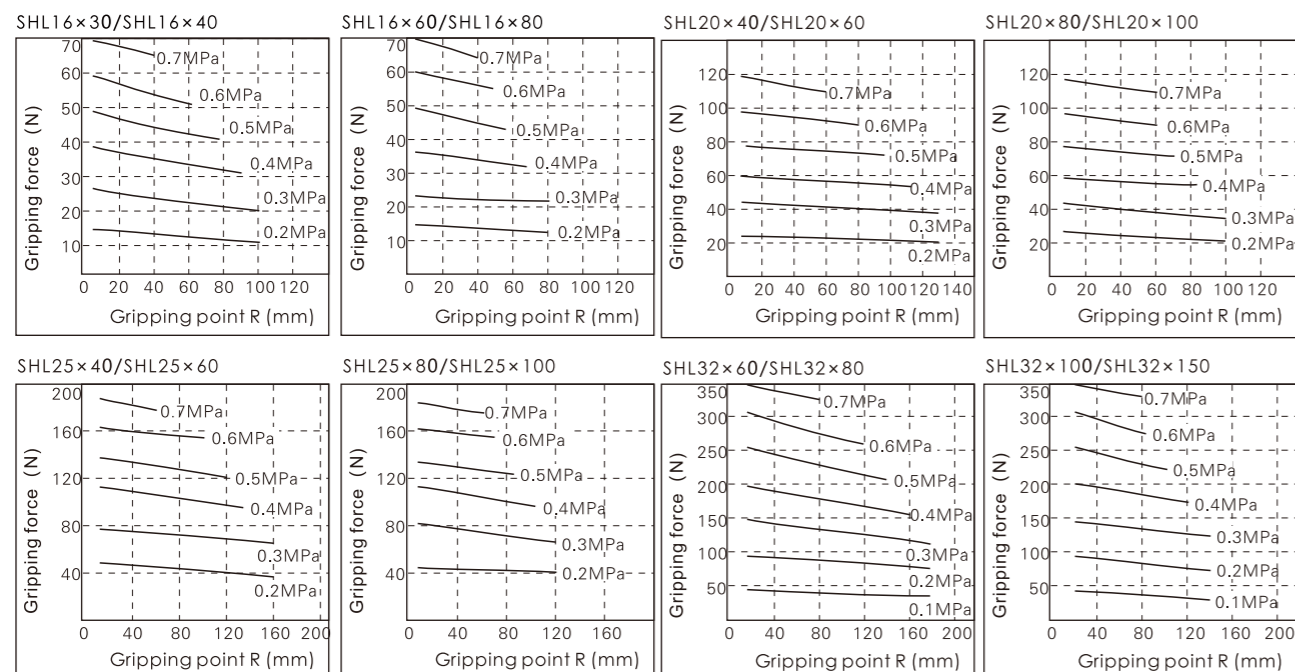

2. Gripping Point

- The workpiece gripping point distance should be within the gripping force ranges given for each pressure in the effective gripping force graphs below.
- If operated with the workpiece gripping point beyond the indicated ranges, the load that will be applied to the fingers or the guide will become excessively unbalanced. As a result, the fingers could become loosened and adversely affect the service life of the unit.

3. Effective Gripping Force

The gripping force shown in the tables represents the gripping force of one finger when all fingers and attachments are in contact with the work.

Installation and application

- Due to the abrupt changes, the circuit pressure is low, which will lead to the decrease of the gripping force and falling of the work-pieces. In order to avoid the harm to the human body and damage to the equipment, anti-dropping device must be equipped.
- Don't use the air gripper under strong external force and impact force.
- When install and fix the air gripper, avoid falling down, collision and damage.
- When fixing the gripping jaw parts, don't twist the gripping jaw.
- There are several kinds of installation method, and the locking torque of fastening screw must be within the prescribed torque range shown in the below chart. If the locking torque is too large, it will cause the dysfunctional. If the locking torque is too small, it will cause the position deviation and fall.

Bore size	The bolts type	Max.locking moment (Nm)	Max.screwed depth (mm)
16	M5 x 0.8	4.3	10
20	M6 x 1.0	7.3	12

16	M5 x 0.8	4.3
20	M6 x 1.0	7.3
25	M8 x 1.25	17.7

Note: Not available for Ø32

16	M5 x 0.8	2.8	7
20	M6 x 1.0	4.8	7
25	M8 x 1.25	12	7
32	M8 x 1.25	12	10

6. The installation method of the gripping jaw fittings:

When install the gripping jaw fittings, you have to pay particular attention that you can only hold the gripping jaw by using spanner, and then lock the screws with alien wrench. Never clamp the body directly and then lock the screws, otherwise the parts will be easily damaged.

7. Confirm that there is no external forces exerted on the gripping jaw.

Transverse load acts on the gripping jaw, which will cause impact load and leads to the shaking and damage of gripping jaw. Equip with gaps so that the air gripper will not crash into work-pieces and accessories at the end of its trip.

7.1. The end of stroke under the open state of air gripper

7.2. The end of stroke under the move state of air gripper

8. When the work-pieces are inserted, the center line should be coaxial, no offset, in case there are external force generated on gripping jaw.

When testing, it is specially required that the manual operation should be reduced, the pressure should be used to run it at a low speed, and guarantee the safety and no impact.

9. Please use the flow control valve to adjust the opening and closing speed of gripping jaw if too fast.

10. People can not enter the movement path of air gripper and articles can not be placed on the path too.

11. Before removing the air gripper, please confirm that it is out of working state, and then discharge of compressed air.

Products Features

1. Stainless steel gripper & linear ball guide design, high precision, good rigidity,good corrosion resistance for longer life spans.
2. Double piston structure design can provide bigger clamping force.
3. The bottom of the body is equipped with positioning pin holes to effectively enhance the installation accuracy and improve the consistency of repeated disassembly and positioning.
4. The Gripper can be installed from four directions freely.
5. Compared with the parallel air gripper with the same clamping force, this thin body design reduces the overall height by 50%, which effectively reduces the installation space and shaking torque, reduces the deviation, and improves the accuracy.
6. The body is designed with a buried induction switch slot to reduce the space.
7. All series are with magnetic.

Model Selection

Selected Steps

Step 1 Effective gripping force confirmation

Confirmed example

Workpiece mass: 0.15kg

Gripping Method: External diameter

Roughly select the model according to the quality

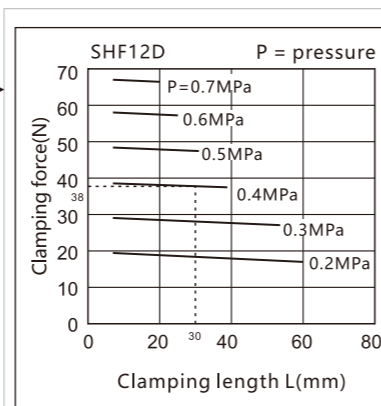

- According to the difference in friction coefficient and shape between the workpiece and the accessories, the type of air gripper with the gripping force of the fingers 10~20 times the weight of the workpiece should be selected.
- *Check detailed information from the explanatory drawing.
- If bigger accelerated speed or impact force in the application, more extra allowance requested.

Example of calculation

When you want to set the clamping force to be 20 times or more the weight of the workpiece.
Necessary clamping force = $0.15\text{kg} \times 20 \times 9.8\text{m/s}^2 = 29.4\text{N}$ or more

Grip point distance: 30mm

Working pressure: 0.4MPa

Occasion To Try SHF12D

- From the intersection of the clamping point $L=30\text{mm}$ and the pressure $P=0.4\text{MPa}$, find the clamping force
Clamping $N=38\text{N}$
- The clamping force of 38 meets the necessary clamping force of 29.4N, so SHF12D can be selected.

Model Selection

Model selection instructions

About 10-20 times the weight of the workpiece

The recommended value (more than 10-20 times the weight of the workpiece) is calculated based on the impact generated by normal handling, etc., under the condition of the safety value $a=4$.

When $\mu=0.2$	When $\mu=0.1$
$F = \frac{mg}{2 \times 0.2} \times 4$	$F = \frac{mg}{2 \times 0.1} \times 4$
$= 10 \times mg$	$= 20 \times mg$
10 times the workpiece mass	20 times the workpiece mass

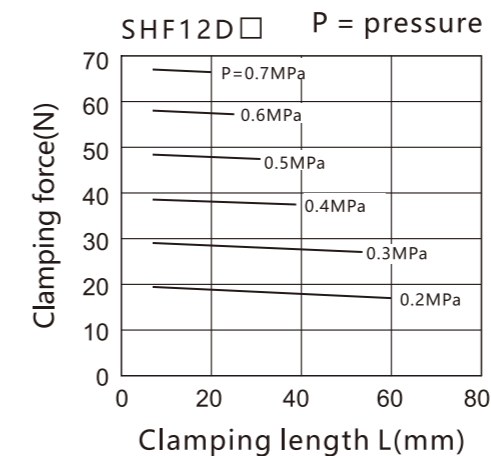

Note: 1. When the friction coefficient is higher than $\mu=0.2$, for safety, our company recommends that the model should be selected at 10 to 20 times the weight of the workpiece.

2. For excessive acceleration and impact, it is necessary to select a larger safety value.

Step 1 Confirmation of Effective Grip Force

Representation of Effective Grip Force

The effective clamping force of the right picture, as shown in the figure below, the two fingers and accessories are in contact with the workpiece together, and the thrust on one finger is represented by F.

When clamping the workpiece shown on the left

- F: Clamping force(N)
- μ : Friction coefficient of attachments and work pieces
- m: Workpiece mass(kg)
- g: Gravitational acceleration(=9.8m/s²)
- mg: Workpiece gravity(N)

If the workpiece does not fall

$$2 \times \mu F > mg$$

Number of Fingers

Then

$$F > \frac{mg}{2 \times \mu}$$

The safety value is represented by a, and F is determined

$$F = \frac{mg}{2 \times \mu} \times a$$

Model Selection

Step 2 Confirmation of clamping point

1. The clamping point of the workpiece, according to the operating pressure, should be within the range shown in the figure below.
2. If the clamping point of the workpiece are out of the range, it will reduce the service life of the gripper.

Inner diameter clamping state

Outer diameter clamping state

Model Selection

Step 3 Confirmation of external force on fingers

L: The distance to the load application point

Model	Vertical direction Allowable load Fv(N)	Maximum allowable torque		
		Bending torque Mp(N.m)	Deflection torque My(N.m)	Rotation torque Mr(N.m)
SHF12D	98	0.68	0.68	1.4
SHF16D	176	1.4	1.4	2.8

Note: The load and moment values in the table are static values

Calculation of allowable external force (when moment load is applied)	Example of calculation
$\text{Allowable load } F(N) = \frac{M(\text{maximum allowable moment}) (N.m)}{L \times 10^{-3} \times \text{※}}$ <p>(※ Is the unit conversion constant)</p>	<p>When the actual static load $f=10N$, the bending moment of the point $L=30mm$ from the end face of the jaw of SHF2-12D</p> $\text{Allowable load } F = \frac{0.68}{30 \times 10^{-3}}$ $= 22.7 (N)$ <p>Load $f=10(N) < 22.7(N)$</p> <p>so you can use.</p>

Installation and Use

1. When installing, do not let the air gripper fall or be hit, so as to avoid damage to the product and dents.

Slight deformation will cause poor accuracy and work not well.

2. When installing accessories, please properly tighten the screws within the limited torque range.

Tightening with a torque out of the torque range may cause malfunction, and if the tightening torque is insufficient, positional displacement or drop may occur.

How to install the gripper attachment

Attach the attachment to the mounting female thread of the jaws with screws, etc., using the tightening torque in the table below.

Model	Screws used	Maximum tightening torque N.m
SHF12D	M4×0.7	0.63
SHF16D	M5×0.8	1.5

3. When installing the air gripper, please properly tighten the screws within the limited torque range.

Bad action if bigger tighten torque;

Position offset or fall if smaller tighten torque.

How to install the gripper attachment

Top mount type (main body screw hole)

Model	Screws used	Maximum tightening torque N.m	Maximum thread entry depth Lmm
SHF12D	M4×0.7	2.2	10
SHF16D	M5×0.8	4.5	12

Use Environment

Pay attention to the corrosion resistance of linear guides.

The materials of Fingers & guides are martensitic stainless steel, which is weaker than. Martensitic stainless steel is used on fingers and rails; compared with austenitic stainless steel, the corrosion resistance is weak; especially in the environment where there are water droplets such as freezing dew, there is a problem of rust

Side Mount Type (Through Hole in Body)

Model	Screws used	Maximum tightening torque N.m	Maximum thread entry depth Lmm
SHF12D	M4×0.7	1.5	5
SHF16D	M5×0.8	3	5.5

Bottom mount type (main body screw hole, main body through hole)

1. Use the main body screw holes

Model	Screws used	Maximum tightening torque N.m	Maximum thread entry depth Lmm
SHF12D	M4×0.7	1.5	5
SHF16D	M5×0.8	3	5.5

2. Use the empty holes without thread

Model	Screws used	Maximum tightening torque N.m	Maximum thread entry depth Lmm
SHF12D	M3×0.5	0.63	—
SHF16D	M4×0.7	1.5	—

Note: When the SHF12, 16 thin air gripper is installed through the main body, the commercially available hexagon socket screws can be used; the screw depth depends on the specific installation situation.

Model Selection Method

1. Cylinder theoretical force confirmation: Select the bore size according to the thrust and practicality, refer to the below table.
2. Determine the selection conditions in order, starting from the upper row in the table below, and choose one of the selection graphs to be used.

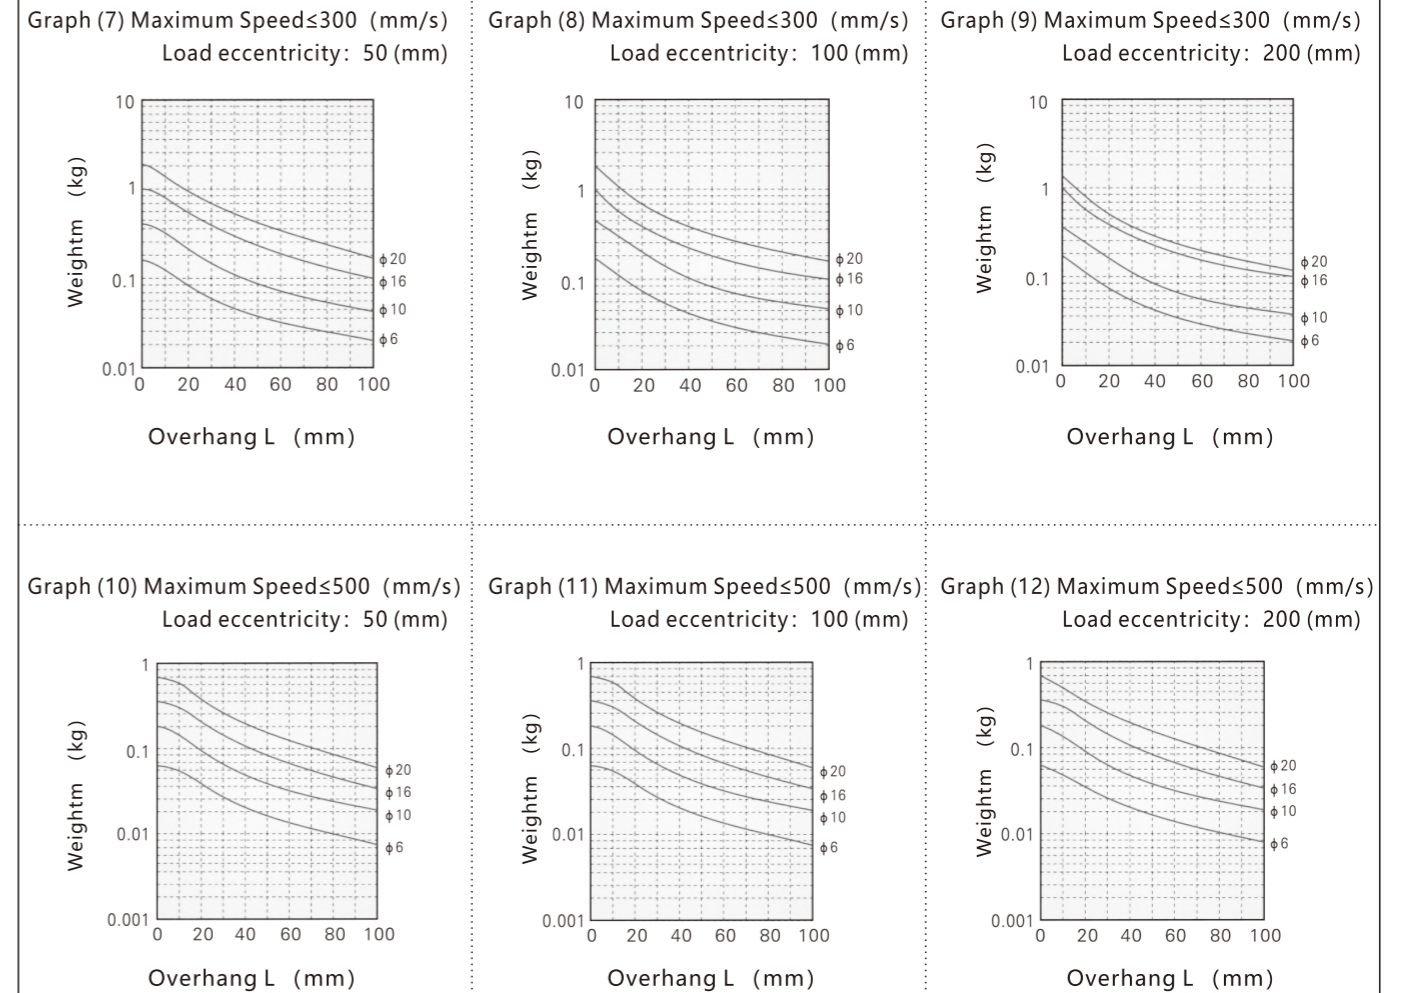

Mounting position	Vertical			Horizontal								
Maximum Speed (mm/s)	≤100	≤300	≤500	≤100			≤300			≤500

Note: L can also be the angular distance between the load centre of gravity and the cylinder shaft centre as shown in the right figure.

2.1 The relation between loading and overhang(Selection graphs)

Model Selection Method

2.2 Selection example

Example 1: Mounting: Vertical

- Maximum Speed: 500 mm/s
- Overhang: 40 mm
- Load weight: 0.1 kg

Refer to Graph 3 base on vertical mounting and a speed of 500 mm/s

In graph 3, find the intersection of a 40mm overhang and load weight of 0.1kg, which results in a selection of $\Phi 20$

Example 2: Mounting: Horizontal

- Maximum Speed: 500 mm/s
- Load eccentricity: 50 mm
- Overhang: 30 mm
- Load weight: 0.1 kg

Refer to Graph 10 base on horizontal mounting and a speed of 500 mm/s and load eccentricity of 50mm. In graph, find the intersection of a 30mm overhang and load weight of 0.1kg, which results in a selection of $\Phi 16$.

Installation and application

1. The actual loading and torque of cylinder must be less than its allowable loading and torque:

1.1 The allowable moment of cylinder

Model	Allowable torque(N.m)		
	Pitch Moment Mp	Yaw Moment My	Roll Moment Mr
EXH6	0.25	0.25	0.41
EXH10	0.95	0.95	1.49
EXH16	3.28	3.28	3.45
EXH20	6.29	6.29	6.61

1.2 When the cylinder is subjected to different type of torque, there will be different degree of shift in performance, please refer to the following table for details.

Installation and Application

2. The compact slide can be piped in 3 directions. Confirm the pressure ports and operating direction. (See drawing right);

3. In compact slides with sensor switch, there is a danger of sensor switch malfunction if the mounting pitch is less than the dimensions shown in Table right. Be sure to allow at least the indicated interval.

Model	At least indicated interval (mm)	
	d	L
EXH6	5	21
EXH10	5	25
EXH16	10	35
EXH20	15	47

4. When the output of the compact slide will be directly applied to the table, it should be applied along the rod axis. (See drawing below)

5. Be sure to use a flow control valve, and adjust the speed to 500mm/s or less.
6. A compact slide can be mounted from 4 directions. Don't exceed the max. fastening torque to tighten the mounting bolts.

7. Work Piece Mounting:

7.1 Work pieces can be mounted on 2 surfaces of the compact slide. When mounting a work piece, tighten the bolts at a torque value within the limiting range.

When mounting a work piece on top of the table, do not screw the bolt deeper than the thread length in the table (See below table L), otherwise the bolt will damage the linear guide.

Front Mounting

7.2 Since the table is supported by the linear guide, take care not to apply strong impact or large moment to the guide section.

7.3 Hold the slide when fastening work pieces with bolts, if the body is held while tightening bolts, excessive moment may damage guide section.

Hold the slide and fasten the bolt Hold the body and fasten the bolt

Order Example:
ELS Series Basic type cylinder, bore size 20, stroke 50, with Magnet, without adjuster, thread type G. The ERP code is: ELS20X50-S

Optional Accessories

- Blank: None adjuster
- A: Adjusters on both ends
- AS: Forward adjuster
- AF: Backward adjuster
- B: Shock absorber on both ends
- BS: Forward shock absorber
- BF: Backward shock absorber
- (Note: Shock absorber is not available for φ6)

Note: Short stroke please use HX-29 series due to limited space.

Installation and Operation

1. How to mount cylinder:

1.1 Cylinder can be mounted from 3 directions.

1.2 When mounting an compact slide cylinder, screws of appropriate length should be used and tightened properly within the maximum tightening torque. If screws are tightened beyond designed limits, malfunction may occur. If they are tightened insufficiently, it may result in sliding or falling off from its position.

Vertical Mounting (Body thread holes)	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELS6	M4X0.7	2.1	8
	ELS8	M4X0.7	2.1	8
	ELS12	M5X0.8	4.4	10
	ELS16	M6X1.0	7.4	12
	ELS20	M6X1.0	7.4	12
	ELS25	M8X1.25	18	16

Vertical Mounting (Body through holes)	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELS6	M3X0.5	1.2	10.8
	ELS8	M3X0.5	1.2	12.5
	ELS12	M4X0.7	2.8	18

	ELS20	M5X0.8	5.7	23.5
	ELS20	M5X0.8	5.7	23.5
	ELS25	M6X1.0	10	34.5

Axial Mounting (Body tapped holes)	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELS6	M2.5X0.45	0.5	3.5
	ELS8	M3X0.5	0.9	4.0
	ELS12	M4X0.7	2.1	6.0
	ELS16	M5X0.8	4.4	7.0
	ELS20	M5X0.8	4.4	8.0
	ELS25	M6X1.0	7.4	10.0

2. Work Piece Mounting:

2.1 Work pieces can be mounted on 2 surfaces of the compact slide.

2.2 When mounting a work piece, tighten the bolts properly at a torque value within the limiting range. Use bolts at least 0.5mm shorter than maximum thread depth to prevent bolts from contacting the guide block. If the bolts are too long, they hit the guide block and cause damage.

Front Mounting	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELS6	M3X0.5	0.9	5
	ELS8	M4X0.7	2.1	6
	ELS12	M5X0.8	4.4	8
	ELS16	M6X1.0	7.4	10
	ELS20	M6X1.0	7.4	13
	ELS25	M8X1.25	18	15

Top Mounting	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELS6	M3X0.5	0.9	4
	ELS8	M3X0.5	0.9	4.5
	ELS12	M4X0.7	2.1	5.5
	ELS16	M5X0.8	4.4	7.5
	ELS20	M5X0.8	4.4	9.5
	ELS25	M6X1.0	7.4	13

2.3 Since the table is supported by the linear guide, take care not to apply strong impact or large moment to the guide section.

2.4 Hold the slide when fastening work pieces to it with bolts, if the body is held while tightening bolts, excessive moment may damage guide section.

3. About shock absorber:

3.1 Shock absorbers are expendable parts. Promptly replace them when energy absorbing capacity decreases.

3.2 Never turn or adjust the screws on bottom of the shock absorber body. The screws are not for adjusting. Otherwise would cause oil leakage.

3.3 Follow the table for tightening torque of shock absorber to lock nuts.

Model	Shock absorber	Tightening torque (Nm)
ELS8	AC0806-WY	1.67
ELS12	AC0806-WY	1.67
ELS16	AC1008-WY	3.14
ELS20	AC1416-WY	10.8
ELS25	AC1416-WY	10.8

4. How to mount sensor switch:

4.1 ELS Series are all with magnet.

4.2 Maintain a minimum spacing of at least 3mm if two compact cylinders are used side by side in order to avoid malfunction.

5. Make sure to connect the compact cylinder to speed controller at the meter-out side, and the speed of compact cylinder must be below 500mm/s.

Model Selection Method

Please select compact cylinder's type according to following procedure, and cross reference with data sheets.

1. Operating conditions (According to mounting position and work form)

- 1.1 Model used (Bore size, Stroke)
- 1.2 Type of cushion (Bumper, Shock absorber)
- 1.3 Mounting position of work (Top, front)
- 1.4 Mounting direction (Axial, Vertical)
- 1.5 Average speed V_a (mm/s)
- 1.6 Applied load W (N) **Fig. 1**
- 1.7 Overhang $L1, L2, L3$ (mm)

Fig. 1 Applied load

3. Load Check

Detailed procedures

3.1 Calculate allowable applied load W_a (N)

$$W_a = K \times \beta \times W_{max}$$

K : Mounting work coefficient (Fig 2) W_{max} : Maximum allowable applied load (Table 1)
 β : Applied load coefficient (Fig 3)

3.2 Check that load (W) doesn't exceed allowable applied load (W_a)

$$W \leq W_a$$

Fig. 2 Mounting work coefficient (K)

Fig. 3 Applied load coefficient (β)

2. Kinetic energy check

Detailed procedures

2.1 Calculate kinetic energy of load E (J)

$$E = \frac{1}{2} \times \frac{W}{g} \times (1.4 \times V_a)^2$$

2.2 Calculate allowable kinetic energy E_a (J)

$$E_a = K \times E_{max}$$

K : Mounting work coefficient (Fig 2) E_{max} : Maximum allowable kinetic energy (Table 1)

2.3 Check that kinetic energy of load doesn't exceed allowable kinetic energy

$$E \leq E_a$$

4. Moment check4

Detailed procedures

Horizontal

* Calculate actual moment: $M_p, M_{po}, M_y, M_{yo}, M_r, M_{ro}$ (Nm)

Dynamic moment:
 $M_p = W \times (L1 + A) / 1000$
Static moment:
 $M_{po} = \frac{W \times (L1 + A)}{1000} + \frac{W \times a \times (L2 + B)}{1000 \times g}$

Dynamic moment:
 $M_r = W \times (C + L3) / 1000$
Static moment:
 $M_{ro} = (W \times a \times (C + L3)) / 1000g$

Dynamic moment:
 $M_y = 0$
Static moment:
 $M_{yo} = (W \times a \times (C + L3)) / 1000g$

* Check

$$\frac{M_p}{M_{pmax}} + \frac{M_y}{M_{ymax}} + \frac{M_r}{M_{rmax}} \leq 1$$

$$\frac{M_{po}}{M_{po_max}} + \frac{M_{yo}}{M_{yo_max}} + \frac{M_{ro}}{M_{ro_max}} \leq 1$$

Vertical

* Calculate actual moment: $M_p, M_{po}, M_y, M_{yo}, M_r, M_{ro}$ (Nm)

Dynamic moment:
 $M_p = W \times (L2 + B) / 1000$
Static moment:
 $M_{po} = \frac{W \times (L2 + B)}{1000} + \frac{W \times a \times (L2 + B)}{1000 \times g}$

Dynamic moment:
 $M_r = W \times (C + L3) / 1000$
Static moment:
 $M_{ro} = \frac{W \times a \times (C + L3)}{1000g} + \frac{W \times (C + L3)}{1000}$

Dynamic moment:
 $M_y = 0$
Static moment:
 $M_{yo} = 0$

*** Check**

$$\frac{M_p}{M_{pmax}} + \frac{M_y}{M_{ymax}} \leq 1$$

$$\frac{M_{po}}{M_{po_max}} + \frac{M_{yo}}{M_{yo_max}} \leq 1$$

Explain:
 The distance of load center to mount plane (Determined by actuality).
 A, B, C: Correction value for center position distance of moment (Refer to table 2).
 $M_{pmax}, M_{ymax}, M_{rmax}, M_{po_max}, M_{yo_max}, M_{ro_max}$: Maximum allowable moment (Refer to table 2);
 g : Acceleration of gravity ($g = 9.81 m/s^2$);
 a : Acceleration of inertia
 $a = 1600 \times (V_a / 1000)^2$; Shock absorber
 $a = 400 \times (V_a / 1000)^2$
 W : Load weight (Determined by actuality).

Installation and Operation

1. How to mount cylinder:

1.1 Cylinder can be mounted from 3 directions.

1.2 When mounting an compact slide cylinder, screws of appropriate length should be used and tightened properly within the maximum tightening torque. If screws are tightened beyond designed limits, malfunction may occur. If they are tightened insufficiently, it may result in sliding or falling off from its position.

Vertical Mounting (Body thread holes)	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELQ6	M4X0.7	2.1	8
	ELQ8	M4X0.7	2.1	8
	ELQ12	M5X0.8	4.4	10
	ELQ16	M6X1.0	7.4	12
	ELQ20	M6X1.0	7.4	12
	ELQ25	M8X1.25	18	16

Vertical Mounting (Body through holes)	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELQ6	M3X0.5	1.2	10.8
	ELQ8	M3X0.5	1.2	12
	ELQ12	M4X0.7	2.8	13.5
	ELQ16	M5X0.8	5.7	16.5
	ELQ20	M5X0.8	5.7	22
	ELQ25	M6X1.0	10	28

Axial Mounting (Body through holes)	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELQ6	M2.5X0.45	0.5	3.5
	ELQ8	M3X0.5	0.9	4.0
	ELQ12	M4X0.7	2.1	6.0
	ELQ16	M5X0.8	4.4	7.0
	ELQ20	M5X0.8	4.4	8.0
	ELQ25	M6X1.0	7.4	10.0

2. Work Piece Mounting:

2.1 Work pieces can be mounted on 2 surfaces of the compact slide.

2.2 When mounting a work piece, tighten the bolts properly at a torque value within the limiting range. Use bolts at least 0.5mm shorter than maximum thread depth to prevent bolts from contacting the guide block. If the bolts are too long, they hit the guide block and cause damage.

Front Mounting	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELQ6	M3X0.5	0.9	5
	ELQ8	M4X0.7	2.1	6
	ELQ12	M5X0.8	4.4	8
	ELQ16	M6X1.0	7.4	10
	ELQ20	M6X1.0	7.4	13
	ELQ25	M8X1.25	18	15

Top Mounting	Model	Bolt used	Max. tightening torque (Nm)	Max. screw-in depth (mm)
	ELQ6	M3X0.5	0.9	4
	ELQ8	M3X0.5	0.9	4.5
	ELQ12	M4X0.7	2.1	5.5
	ELQ16	M5X0.8	4.4	7.5
	ELQ20	M5X0.8	4.4	9.5
	ELQ25	M6X1.0	7.4	13

2.3 Since the table is supported by the linear guide, take care not to apply strong impact or large moment to the guide section.

2.4 Hold the slide when fastening work pieces to it with bolts, if the body is held while tightening bolts, excessive moment may damage guide section.

3. About shock absorber:

3.1 Shock absorbers are expendable parts. Promptly replace them when energy absorbing capacity decreases.

3.2 Never turn or adjust the screws on bottom of the shock absorber body. The screws are not for adjusting. Otherwise would cause oil leakage.

3.3 Follow the table for tightening torque of shock absorber to lock nuts.

Model	Shock absorber	Tightening torque (Nm)
ELQ8	AC0806-WY	1.67
ELQ12	AC0806-WY	1.67
ELQ16	AC1008-WY	3.14
ELQ20	AC1416-WY	10.8
ELQ25	AC1416-WY	10.8

4. How to mount sensor switch:

4.1 ELQ Series are all with magnet.

4.2 Maintain a minimum spacing of at least 3mm if two compact cylinders are used side by side in order to avoid malfunction.

5. Make sure to connect the compact cylinder to speed controller at the meter-out side, and the speed of compact cylinder must be below 500mm/s.

Installation and Operation

1. Load capacity of the ESW rodless cylinder series is determined by the theoretical holding force (theoretical thrust). The weight of the load cannot exceed the theoretical holding force, as stated at below chart.

2. The downward bending deflection of the cylinder self-weight

Horizontal installation: the downward bending deflection of self-weight is shown in the figure below. As the stroke becomes longer, variations in the center axis become larger. Consider using a connection method that is able to absorb these bending deflection.

Note: Please reserve clearance according to the self-weight downward bending range shown in the right figure to prevent the cylinder from touching the installation surface or the load, so that the cylinder can slide smoothly within the minimum pressure range.

Note: the data of downward bending range is measured when the external slider moves to the middle of the stroke.

3. Maximum load including the adapting piece

Load cannot be installed on the ESW series cylinders directly, please use other axis (linear guide rail, etc.) as oriented device. Maximum load including the adapting piece must be lower than the figures in the chart below.

Model	Maximum Load(KG)
ESW16	1.0
ESW20	1.1
ESW25	1.2
ESW32	1.5

Installation and Operation

4. Vertical movements

- 4.1 Please use rolling bearing (linear guide rail, etc.) as oriented device. If the sliding bearing was used, the sliding resistance will increase due to the load and the torque generated by the load, resulting in poor movement.

Model	Allowable load weight(KG)	Maximum working pressure(MPa)
ESW16	7.0	0.65
ESW20	11.0	0.65
ESW25	18.5	0.65
ESW32	30.0	0.65

Note: If the actual pressure exceeds the maximum working pressure, the magnetic coupling is at risk of demagnetizing, attention please.

5. In case of stopping the slider halfway, please refer to the specific parameters in below chart

- 5.(1) If using an external stopper is used to stop the cylinder, working pressure cannot exceed the specified values listed in the chart below. Once the applied pressure exceeds the threshold limited, the magnetic coupling is at risk of demagnetizing, attention please..

Model	Maximum threshold value while stop halfway (MPa)
ESW16	0.65
ESW20	0.65
ESW25	0.65
ESW32	0.65

- 5.(2) If using a pneumatic circuit to stop the cylinder, the kinetic energy cannot exceed the specified values listed in the chart below. Once the applied pressure exceeds the threshold limited, the magnetic coupling is at risk of demagnetizing, attention please.

Model	Allowable kinetic energy while stop halfway(Es)(J)
ESW16	0.13
ESW20	0.24
ESW25	0.45
ESW32	0.88

5. (3) If the load is stopped at the end of stroke , cylinder may be tilted due to the big inertia and both the bearing and cylinder barrel will be damaged.(as shown in the left picture below). By using a stopper and a shock absorber together, the thrust will be passed through the cylinder body to avoid cylinder tilting. (as shown in the right picture below).

5. (4) In a vertical installation situation, a pneumatic circuit cannot be used to stop the cylinder. Piston stopped because of pressure increase, but the magnetic coupling is at risk of demagnetizing due to the weight and inertia of the load.

About Shock Absorber

- Shock absorbers are consumable parts. When a decrease in energy absorption capacity is noticed, it must be replaced. Refer to the table below for the absorber type. Please order corresponding shock absorber according to the table and replace the old ones according to the procedure.
- Never loosen the bottom screw of the shock absorber. (It is not an adjustment screw.) That may cause oil leakage.
- Refer to the table below for tightening torques of the shock absorber setting nut.

Model	ESWT16	ESWT20	ESWT25	ESWT32
Shock absorber type	AC0806-WY	AC1008-WY	AC1416-WY	AC2030-WY
Tightening torque(Nm)	1.67	3.14	10.8	10.8

About Sensor Switch

- Sensor switch only can be used for the cylinder with magnet. The magnet located the four corner of body's (refer below). The cylinder with magnet have both group mounting hole for mounting rail. Please refer to below to order sensor switch, mounting it into the rail's groove, adjusting it to proper position, tightening it with proper torque.

2. How to choose the magnet switch ?

If the customer needs to be equipped with HX-01 switch, the magnet switch base must be rotated 180° to install

Model	ESWT16-S	ESWT20-S	ESWT25-S	ESWT32-S
Sensor switch type	HX-01, HX-07			

Please refer to the detailed information of sensor switch on page 3.166~3.174

Bore size,mm	20	25	32	40
Acting type	Double Acting/Single Acting			
Working medium	Clean Air(40 μm filtration)			
Working pressure (MPa)	0.1~1.0(Double Acting) / 0.2~1.0(Single Acting)			
Guaranteed pressure (MPa)	1.5			
Working temperature (°C)	-20~80(No freezing)			
Speed range (mm/s)	Double Acting: 30~800		Single Acting:50~800	
Cushion type	Rubber cushion / Air cushion			
Barrel material	Aluminum alloy			
Mounting type	LB FA SDB			
Port size	G1/8 ①			G1/4 ①

① PT, NPT port size is optional.

SFM Guide Rod Type Cylinder

Specifications

Bore(mm)	20	25	32	40
Acting type	Double Acting			
Working medium	Clean Air(40 μm filtration)			
Working pressure(MPa)	0.1~1.0			
Garanteed pressure(MPa)	1.5			
Working temperature(°C)	-20~80(No freezing)			
Speed range(mm/s)	30~500			
Stroke tolerance(mm)	+1.0 0			
Cushion type	Rubber cushion			
Port size	M5X0.8		G1/8	

● NPT, PT port size is optional.

How to Order?

SFM	20 25 32 40		5 10 15 ...	Blank: No magnet S : With magnet	Blank: G P: PT T: NPT

Order Example:
SFM series basic cylinder, bore 25mm, stroke 20mm, with magnet, G thread,
ERP code is: SFM25X20-S

Optional Accessories

Note: Short stroke please use HX-29 series due to limited space.

Installation and Use

1. Dirty substances in the pipe must be eliminated before cylinder is connected with pipeline to prevent the entrance of impurities into the cylinder.
2. The medium used by cylinder shall be filtered to 40 μm or below.
3. Anti-freezing measure shall be adopted under low temperature environment to prevent moisture freezing.
4. If the cylinder is dismantled and stored for a long time, please conduct anti-rust treatment to the surface. Anti-dust jam cap shall be added in air inlet and outlet ports.
5. To insure the life-span of cylinder and jig, please use flow control valve to control the speed of cylinder.
6. The method of installation are mounted by flange on top or bottom.

7. Please clean the piston rod and dust scraping ring to protect the cylinder.
8. Magnetic switch of SQK is same as SQ series cylinder.
9. Please install the cylinder as below diagram.

10. The installation method as the diagram below is wrong, and will injure the cylinder and shorten the cylinder life.

11. Please follow the diagram below on right side to assemble/disassemble the rocker by spanner and allen wrench, don't hold the body to assemble/disassemble rocker, or will damage the cylinder.

PAB Mounting Band

◎ PAB series fixed steel belt (Fixed size for round body cylinder, HX-13 auto switch)

	Step 1	Step 2	Step 3	Step 4
	Put the magnetic switch in the steel belt.	Get around the steel belt and magnetic switch.	Insert the steel belt into the slot, adjust the release of the switch, tighten the screw on the steel belt.	After adjusting the position of magnetic switch, fixed steel belt
<p>PAB - S 2 0 Bore</p> <p>S: The Round Barrel Cylinder (stainless steel material) Applicable to bore: 06、08、10、12、16、20、25、32、40、50、63</p> <p>A: The Round Barrel Cylinder (aluminum alloy material) Applicable to bore: 16、20、25、32、40</p>				

Note: This steel belt cannot be used in EG series round cylinder

◎ PAB-13 series mounting band (Universal for HX-13 auto switch)

	Step 1	Step 2	Step 3	Step 4
	1. Loosen the screw on the steel belt first 2. Make sure that three to four circle of thread at the bottom of the screw is still in the nut	1. Get the steel belt through the hole at the bottom of HX-13 2. Put the screw head into the slot of the clip as below picture, then tighten the steel belt 3. Get the steel belt around the cylinder as below picture, then tighten the steel belt 4. Mark on the round hole of the nearest PIN of the belt	1. Loosen the steel belt 2. Mark the hole as below picture, and cut the belt on the second hole away from the mark hole	1. Put the belt that's just been cut down into the slot hole of the steel belt 2. Put the chuck PIN onto the mark hole 3. Use the thumb to press down the steel belt along the chuck, bending the belt 4. Assemble the switch and the cylinder as below picture, then adjust the position of magnet switch, lock the screw, then you could fix it.
<p>Attention! Please don't lock the screw with too much force, otherwise might cause damage on magnet switch or cylinder.</p>
